THE AFFINITY CLADDING SYSTEM

The Affinity Cladding System™ by Dimond is the only BRANZ Appraised profiled metal cladding system in New Zealand and is faster and simpler to install than ever before.

The system comprises a choice of metal cladding profiles run horizontally, and a complete set of flashing components for window, meter box and door openings, internal and external corners, joints to other cladding materials, soffit and base finishing, abutting walls and balustrades.

The Affinity Cladding System™ is appraised for use with Dimond Corrugate (pictured) as well as Pacific™ & Sahara® wall cladding (our two new wall cladding profiles which are unique to the NZ market).

This system significantly reduces the amount of on-site cutting and measuring making installation much simpler and faster. Moreover it does not require any application of sealant to ensure a weathertight fit.

Dimond has worked with the Building Research Association of New Zealand to rigorously test and appraise this system giving you the peace of mind that it works.

Complete CAD details are available for the BRANZ appraised Affinity™ Cladding System including penetrations such as windows and meter boxes.

NZ BUILDING CODE COMPLIANCE

The Affinity Cladding System has been tested and has passed the NZ Building Code E2 / VM1 requirements for weather tightness. Assessment by BRANZ has resulted in compliance with every relevant aspect of the NZ Building Code and the issuing of BRANZ Appraisal No. 596
